

CLAIMS

What is claimed as being new and desired to be protected by LETTERS PATENT of the United States is as follows:

1. A stirring beverage brewing press system for brewing, agitating and
5 compressing of beverage grounds in a beverage press comprising:
a container including a side wall, an open end and a closed end;
a stirring member adapted to be slidably inserted in said container, said stirring
member having a shaft extending up therefrom;
a plunger adapted to be slidably inserted in said container, said plunger having
10 a hollowed shaft extending up therefrom; and
wherein said hollow shaft of said plunger is adapted to receive said shaft of
said stirring member, thereby allowing said stirring member and said
shaft to rotate freely and independently with said plunger and said
hollow shaft.
- 15 2. The stirring beverage brewing press system of claim 1, wherein said
sidewall, said closed end, and said open end of said container defines a cylinder.
3. The stirring beverage brewing press system of claim 1, wherein said
stirring member comprises at least one paddle.
4. The stirring beverage brewing press system of claim 3, wherein said
20 paddle features an arcuate shape.
5. The stirring beverage brewing press system of claim 1 further
comprising a handle attachable to said hollow shaft of said plunger opposite of said
plunger, said handle comprises a bore therethrough adapted to receive said shaft of
said stirring member.
- 25 6. The stirring beverage brewing press system of claim 5 further
comprising a lid, said lid having a cavity positioned on the top surface of said lid and
sized to receive said handle, wherein said lid has an aperture defined from the bottom

of said cavity to the bottom of said lid, said aperture being adapted to allow said hollow shaft to extend therethrough.

7. The stirring beverage brewing press system of claim 6, wherein said handle includes at least one detent projecting from said handle, and said cavity of
5 said lid includes at least one channel configured to receive said detent of said handle.

8. The stirring beverage brewing press system of claim 1, wherein said plunger is a perforated plate.

9. The stirring beverage brewing press system of claim 1, wherein said plunger is a screen plate.

10 10. The stirring beverage brewing press system of claim 1, wherein said plunger comprises a perforated bottom plate, a screen plate, and a perforated upper plate.

11. A stirring beverage brewing press system comprising:
a container including a side wall, an open end and a closed end;
15 a stirring member adapted to be slidably inserted in said container, said stirring member having a shaft extending up therefrom;
a perforated plunger adapted to be slidably inserted in said container, said plunger being attachable to a hollow shaft;
a screen plate adapted to be slidably inserted in said container, said screen
20 plate having a hole able to receive said hollow shaft therethrough;
a lid attachable to said open end of said container, said lid having an aperture adapted to allow said hollow shaft to extend therethrough; and
wherein said hollow shaft of said plunger is adapted to receive said shaft of
said stirring member, thereby allowing said stirring member and said
25 shaft to rotate freely and independently with said plunger and said hollow shaft.

12. The stirring beverage brewing press system of claim 11, wherein said sidewall, said closed end, and said open end of said container defines a cylinder.

13. The stirring beverage brewing press system of claim 11, wherein said stirring member comprises at least one paddle.

14. The stirring beverage brewing press system of claim 11 further comprising a handle attachable to said hollow shaft of said plunger opposite of said plunger, said handle comprises a bore therethrough adapted to receive said shaft of
5 said stirring member.

15. The stirring beverage brewing press system of claim 14 further comprising a lid, said lid having a cavity positioned on the top surface of said lid and sized to receive said handle, wherein said lid has an aperture defined from the bottom
10 of said cavity to the bottom of said lid, said aperture being adapted to allow said hollow shaft to extend therethrough.

16. The stirring beverage brewing press system of claim 15, wherein said handle includes at least one detent projecting from said handle, and said cavity of said lid includes at least one channel configured to receive said detent of said handle.

15 17. The stirring beverage brewing press system of claim 15 further comprising a handle unit adapted to receive said container, wherein said handle unit having at least one ventilation port.

18. A stirring beverage brewing press system comprising:

a container including a side wall, an open end and a closed end;

20 a stirring member adapted to be slidably inserted in said container, said stirring member having a shaft extending up therefrom;

a knob attachable to said shaft opposite of said stirring member;

a perforated plunger adapted to be slidably inserted in said container, said plunger being attachable to a hollow shaft;

25 a screen plate adapted to be slidably inserted in said container, said screen plate having a hole able receive said hollow shaft therethrough, said screen plate being positioned above said perforated plate;

a perforated compression plate adapted to be slidably inserted in said container, said perforated upper plate having a hole able to receive said hollow shaft therethrough, said perforated upper plate being positioned above said screen plate and retained between said hollow shaft and said perforated plate;

a handle attachable to said hollow shaft opposite of said perforated plate, said handle defining a bore therethrough adapted to receive said shaft of said stirring member;

a lid attachable to said open end of said container, said lid having an aperture adapted to allow said hollow shaft to extend therethrough and a cavity in communication with said aperture;

wherein said handle includes at least one detent projecting from said handle, and said cavity of said lid includes at least one channel configured to receive said detent of said handle and preventing said handle from rotating when said handle is inserted in said cavity; and

wherein said hollow shaft of said plunger is adapted to receive said shaft of said stirring member thereby allowing said stirring member and said shaft to rotate freely and independently with said plunger and said hollow shaft.

19 The stirring beverage brewing press system of claim 18, wherein said sidewall, said closed end, and said open end of said container define a cylinder.

20. The stirring beverage brewing press system of claim 18, wherein said stirring member comprises at least one paddle.
